Sound intensity is perceived by our ears as loudness, in the same fashion as a sound's frequency is perceived by our ears as its pitch. The threshold of human hearing has a value of $1 \times 10^{-12} \text{ watts/m}^2$ and is represented by I_0 . This means that in order for us to "hear" a sound, not only must it be within our range of hearing (20-20,000 Hz) but it must also be of sufficient intensity.
