A parabola (plural "parabolas"; Gray 1997, p. 45) is the set of all points in the plane equidistant from a given line L (the conic section directrix) and a given point F not on the line (the focus). The focal parameter (i.e., the distance between the directrix and focus) is therefore given by $p=2a$, where a is the distance from the vertex to the directrix or focus.

Although quadratic equations are often used to find maximums and minimums for problems involving projectile motion, they can also be used to evaluate the path of a projectile at various time periods. For example, quadratic equations can be used to determine the height of a projectile at time " t " after the projectile has been released.
