When two or more waves meet up with each other while moving through the same medium, interference occurs. When you try to observe this phenomenon in real life, the two waves become lost in one another and it becomes difficult to perceive the principles that underlie the phenomenon. But this simulation comes to the rescue, allowing the learner to step through in slow motion and view the ...

In physics, sound is a vibration that typically propagates as an audible wave of pressure, through a transmission medium such as a gas, liquid or solid.. In human physiology and psychology, sound is the reception of such waves and their perception by the brain. Humans can only hear sound waves as distinct pitches when the frequency lies between about 20 Hz and 20 kHz.

The Restoring Force. A vibrating bobblehead often does the back and forth a number of times. The vibrations repeat themselves over and over. As such, the bobblehead will move back to (and past) the equilibrium position every time it returns from its maximum displacement to the right or the left (or above or below).
