PROJECTILE MOTION We see one dimensional motion in previous topics. Now, we will try to explain motion in two dimensions that is exactly called "projectile motion". In this type of motion gravity is the only factor acting on our objects. We can have different types of projectile type. For example, you throw the ball straight upward, or you kick a ball and give it a speed at an angle to the

### Physics Problems with Solutions and Tutorials

Projectile motion is a form of motion experienced by an object or particle (a projectile) that is thrown near the Earth's surface and moves along a curved path under the action of gravity only (in particular, the effects of air resistance are assumed to be negligible). This curved path was shown by Galileo to be a parabola. The study of such motions is called ballistics, and such a trajectory ...

Earlier in Lesson 6, four kinematic equations were introduced and discussed. A useful problem-solving strategy was presented for use with these equations and two examples were given that illustrated the use of the strategy. Then, the application of the kinematic equations and the problem-solving strategy to free-fall motion was discussed and illustrated.
