Colligative Properties of Electrolytes. As noted previously in this module, the colligative properties of a solution depend only on the number, not on the kind, of solute species dissolved. For example, 1 mole of any nonelectrolyte dissolved in 1 kilogram of solvent produces the same lowering of the freezing point as does 1 mole of any other nonelectrolyte.

An electrolyte solution is a solution that generally contains ions, atoms or molecules that have lost or gained electrons, and is electrically conductive. For this reason they are often called ionic solutions, however there are some cases where the electrolytes are not ions. For this discussion we will only consider solutions of ions.

Gatorade as an electrolyte solution: The sports drink Gatorade advertises that it contains electrolytes because it contains sodium, potassium, magnesium, and other ions. When humans sweat, we lose ions necessary for vital bodily functions; to replenish them, we need to consume more ions, often in the form of an electrolyte solution.

### Types of Aqueous Solutions | Boundless Chemistry

Colligative Properties of Solutions. The beads that grab the negative ions such as  $\text{Cl}^-$  release hydroxide ions ( $\text{OH}^-$ ).  $\text{H}^+$  and  $\text{OH}^-$  then combine to make water ( $\text{H}_2\text{O}$ ). In other words, salt ions (one type of electrolytes) comes in, but they are replaced by the electrolytes of  $\text{H}^+$  and  $\text{OH}^-$ , which combine to make pure water.
