When two or more waves meet up with each other while moving through the same medium, interference occurs. When you try to observe this phenomenon in real life, the two waves become lost in one another and it becomes difficult to perceive the principles that underlie the phenomenon. But this simulation comes to the rescue, allowing the learner to step through in slow motion and view the ...

Longitudinal waves are waves in which the displacement of the medium is in the same direction as, or the opposite direction to, the direction of propagation of the wave. Mechanical longitudinal waves are also called compressional or compression waves, because they produce compression and rarefaction when traveling through a medium, and pressure waves, because they produce increases and ...

In physics, the wavelength is the spatial period of a periodic wave—the distance over which the wave's shape repeats. It is thus the inverse of the spatial frequency. Wavelength is usually determined by considering the distance between consecutive corresponding points of the same phase, such as crests, troughs, or zero crossings and is a characteristic of both traveling waves and standing ...
