AP Chemistry - Darrell Feebeck

Chemistry is the scientific discipline involved with elements and compounds composed of atoms, molecules and ions: their composition, structure, properties, behavior and the changes they undergo during a reaction with other substances.. In the scope of its subject, chemistry occupies an intermediate position between physics and biology. It is sometimes called the central science because it ...

What is matter? Matter is everything around you. Atoms and compounds are all made of very small parts of matter. Those atoms go on to build the things you see and touch every day. Matter is defined as anything that has mass and takes up space (it has volume).

The timeline of chemistry lists important works, discoveries, ideas, inventions, and experiments that significantly changed humanity's understanding of the modern science known as chemistry, defined as the scientific study of the composition of matter and of its interactions. The history of chemistry in its modern form arguably began with the Irish scientist Robert Boyle, though its roots can ...

Natural Acidity of Rainwater. Pure water has a pH of 7.0 (neutral); however, natural, unpolluted rainwater actually has a pH of about 5.6 (acidic). [Recall from Experiment 1 that pH is a measure of the hydrogen ion (H^+) concentration.] The acidity of rainwater comes from the natural presence of three substances (CO_2 , NO , and SO_2) found in the troposphere (the lowest layer of the atmosphere).

Because they have these polar groups that also allow for hydrogen bonding, nylons and most condensation polymers are also stronger, more rigid and brittle, and tougher in comparison to most vinyl polymers. Nylons are also "lubrication-free," meaning they do not need lubricant for easy mobility; thus they can be used to make mechanical bearings and gears that do not need periodic lubrication.

Kinetic vs. Thermodynamic Control in Organic Reactions. John Cullen. The concept of kinetic vs. thermodynamic control of reactions is an important one in organic chemistry. There are a number of reactions known in which there are two (or more) possible reaction products of a reaction, and one product (kinetic product) predominates when the reaction is done at low temperature.

In chemistry, a mixture forms when two or more substances are combined such that each substance retains its own chemical identity. Chemical bonds between the components are neither broken nor formed. Note that even though the chemical properties of the components haven't changed, a mixture may exhibit new physical properties, like boiling point and melting point.

Have you ever wondered why we use the symbol "lb" for the "pounds" unit?The word "pound" is short for "pound weight," which was libra pondo in Latin. The libra part of the phrase meant both weight or balance scales. The Latin usage was shortened to libra, which naturally was abbreviated "lb".We adopted the pound part from pondo, yet kept the abbreviation for libra.

Tin is a relatively low melting (232°C) material that exists in two allotropic forms at room temperature and pressure, α -Sn (gray tin) and β -Sn (white tin). α -Sn is the stable form below 13°C and has the diamond structure (Figure 3a).White, or β -Sn is metallic and has a distorted close-packed lattice.
