In probability theory and statistics, two real-valued random variables, X and Y , are said to be uncorrelated if their covariance, $\text{Cov}(X, Y) = E[(X - E[X])(Y - E[Y])]$, is zero. If two variables are uncorrelated, there is no linear relationship between them. Uncorrelated random variables have a Pearson correlation coefficient of zero, except in the trivial case when either variable has zero variance ...

Uncorrelatedness (probability theory) - Wikipedia

In probability theory, two events are independent, statistically independent, or stochastically independent if the occurrence of one does not affect the probability of occurrence of the other (equivalently, does not affect the odds). Similarly, two random variables are independent if the realization of one does not affect the probability distribution of the other.
