Osteogenesis imperfecta (see Byers, 1993) is characterized chiefly by multiple bone fractures, usually resulting from minimal trauma. Affected individuals have blue sclerae, normal teeth, and normal or near-normal stature (for growth curves, see Vetter et al., 1992). Fractures are rare in the neonatal period; fracture tendency is constant from childhood to puberty, decreases thereafter, and ...

In 2 brothers with Bruck syndrome, Shaheen et al. (2010) identified a homozygous 8-bp insertion in the FKBP10 gene (607063.0003). They suggested that their patients and the patients reported by Alanay et al. (2010) with osteogenesis imperfecta may both have had Bruck syndrome and that bisphosphonate therapy may explain the less severe phenotype in their patients.

Bones are hardened tissue made up of calcium and minerals. They are responsible for movement, support, strength and the underlying structure of the body. Diseases can rob the bones of the essential nutrients they need and cause them to weaken and sometimes break. Other disorders can add too much calcium, causing excessive tissue growth and abnormalities.
