The Standard Model of particle physics contains 12 flavors of elementary fermions, plus their corresponding antiparticles, as well as elementary bosons that mediate the forces and the Higgs boson, which was reported on July 4, 2012, as having been likely detected by the two main experiments at the Large Hadron Collider (ATLAS and CMS). However, the Standard Model is widely considered to be a ...

Light is electromagnetic radiation within a certain portion of the electromagnetic spectrum. The word usually refers to visible light, which is the visible spectrum that is visible to the human eye and is responsible for the sense of sight. Visible light is usually defined as having wavelengths in the range of 400–700 nanometres (nm), or  $4.00 \times 10^{-7}$  to  $7.00 \times 10^{-7}$  m, between the ...

Wave-Particle Duality . The theory of wave-particle duality developed by Louis-Victor de Broglie eventually explained why the Bohr model was successful with atoms or ions that contained one electron. It also provided a basis for understanding why this model failed for more complex systems. Light acts as both a particle and a wave.

Most instruments are used to measure the particle size distribution, implying an interest in the width or breadth of the distribution. Experienced scientists typically shun using a single number answer to the question "What size are those particles?", and prefer to include a way to define the width.

This is a repost, so like I've said the other time, it's a nice confirmation of what was expected, but to be picky, it doesn't prove antimatter experiences particle-wave duality, but merely that positrons do.
