Notice that at the endpoints, when  $v = 0$ , the mass has no kinetic energy,  $KE = \frac{1}{2}mv^2$ . Therefore, all of its energy is in the form of elastic potential energy,  $PE_e = \frac{1}{2}kx^2$ . When  $PE_e$  is maximum, the restoring force within the spring is also maximized resulting in the mass' acceleration also being maximized as the spring acts to return the mass to its equilibrium position.

An air vortex cannon works primarily by applying force quickly and efficiently to air molecules contained in a semi-enclosed space. When the stretchy balloon surface at the back of the cannon snaps forward, it collides directly with air molecules, accelerating them towards the opening of the cannon and setting off a chain reaction of high-speed collisions with other air molecules and the sides ...
