Quadrilaterals. In other modules, we defined a quadrilateral to be a closed plane figure bounded by four intervals, and a convex quadrilateral to be a quadrilateral in which each interior angle is less than 180° . We proved two important theorems about the angles of a quadrilateral: The sum of the interior angles of a quadrilateral is 360° .

Review the area of a parallelogram. Squares and rectangles are parallelograms, as is any four-sided shape with two sets of parallel sides. All parallelograms have a simple area formula: area equals

base multiplied by the height, or $A = bh$. If you place the parallelogram flat on a horizontal surface, the base is the length of the side it is standing on.

In Euclidean plane geometry, a quadrilateral is a polygon with four edges (or sides) and four vertices or corners. Sometimes, the term quadrangle is used, by analogy with triangle, and sometimes tetragon for consistency with pentagon (5-sided), hexagon (6-sided) and so on.. The word "quadrilateral" is derived from the Latin words quadri, a variant of four, and latus, meaning "side".
