Because triangles have so many interesting properties that build upon each other, you can count on seeing them on the new SAT. Although the problems that you will encounter won't necessarily be difficult, the key lies in being able to figure out which property or concept to use in order to get to the answer. Here you will be tested on figuring out missing side lengths, and you'll have to brush ...

So in this problem here, we're told that the triangle ACE is isosceles. So that's this big triangle right here. It's isosceles, which means it has two equal sides, and we also know from isosceles triangles that the base angles must be equal. So these two base angles are going to be equal. And this ...

Geometry in ancient Babylon arose from the practical needs of administrators, surveyors, and builders (Britton et al., 2011, 547). From their measurements of fields, walls, poles, buildings, gardens, canals, and ziggurats, a metrical understanding of the fundamental types of practical shapes was forged; typically squares, rectangles, trapezoids and right triangles (), with general triangles ...

Roughly, two geometric figures are congruent when they have exactly the same size and shape. Two geometric figures that are congruent can be superimposed, one on the other, so that they coincide exactly. For example, two figures drawn on a piece of paper are congruent if they can be cut out and matched up perfectly
