Power electronics is the application of solid-state electronics to the control and conversion of electric power.. The first high power electronic devices were mercury-arc valves. In modern systems the conversion is performed with semiconductor switching devices such as diodes, thyristors and transistors, pioneered by R. D. Middlebrook and others beginning in the 1950s.

Power electronics - Wikipedia

Abstract. Thyristors are usually three-terminal devices that have four layers of alternating p-type and n-type material (i.e., three p-n junctions) comprising its main power handling section. In contrast to the linear relation that exists between load and control currents in a transistor, the thyristor is bistable.

In electrical engineering, power engineering, and the electric power industry, power conversion is converting electric energy from one form to another such as converting between AC and DC; or changing the voltage or frequency; or some combination of these. A power converter is an electrical or electro-mechanical device for converting electrical energy. . This could be as simple as a transformer ...

Air gap, also airgap 1) or air-gap 2) - is a non-magnetic part of a magnetic circuit. It is usually connected magnetically in series with the rest of the circuit, so that a substantial part of the magnetic flux flows through the gap.

Un variateur électronique de vitesse est un dispositif destiné à régler la vitesse et le moment d'un moteur électrique à courant alternatif en faisant varier la fréquence et la tension, respectivement le courant, délivrées à la sortie de celui-ci.. Leurs applications vont des plus petits aux plus grands moteurs, comme ceux utilisés par les perceuses.
