Learn AP Physics - Rotational Motion

In physics, motion is the change in position of an object with respect to its surroundings in a given interval of time. Motion is mathematically described in terms of displacement, distance, velocity, acceleration, and speed. Motion of a body is observed by attaching a frame of reference to an observer and measuring the change in position of the body relative to that frame.

Then solve for v as a function of t .. $v = v_0 + at$ [1]. This is the first equation of motion. It's written like a polynomial — a constant term (v_0) followed by a first order term (at). Since the highest order is 1, it's more correct to call it a linear function.. The symbol v_0 [vee nought] is called the initial velocity or the velocity at time $t = 0$. It is often thought of as the "first ...

PROJECTILE MOTION We see one dimensional motion in previous topics. Now, we will try to explain motion in two dimensions that is exactly called “projectile motion”. In this type of motion gravity is the only factor acting on our objects. We can have different types of projectile type. For example, you throw the ball straight upward, or you kick a ball and give it a speed at an angle to the

K inematics derives its name from the Greek word for “motion,” kinema.Before we can make any headway in physics, we have to be able to describe how bodies move. Kinematics provides us with the language and the mathematical tools to describe motion, whether the motion of a charging pachyderm or a charged particle.
