We study geometric properties of GL-spaces. We demonstrate that every finite-dimensional GL-space is polyhedral; that in dimension 2 there are only two, up to isometry, GL-spaces, namely the space whose unit sphere is a square (like ℓ_∞^2 or ℓ_1^2) and the space whose unit sphere is an equilateral hexagon.

This formulation applies to any imaging modality (e.g., electron microscopy (EM) and scanning electron microscopy (SEM), where the MVF and AVF can be measured after segmentation of the image - see Fig. 1), but it is of particular interest to be able to estimate the g-ratio in vivo. MRI provides us with several different contrast mechanisms for estimation of these volume fractions, and given MVF ...
