where the concentrations are those at equilibrium. Although water is a reactant in the reaction, it is the solvent as well, so we do not include  $[H_2O]$  in the equation. The larger the  $K_a$  of an acid, the larger the concentration of  $A^-$  relative to the concentration of the nonionized acid,  $HA$ . Thus a stronger acid has a larger ionization constant than does a weaker acid.

Background. The halting problem is a decision problem about properties of computer programs on a fixed Turing-complete model of computation, i.e., all programs that can be written in some given programming language that is general enough to be equivalent to a Turing machine. The problem is to determine, given a program and an input to the program, whether the program will eventually halt when ...

I am in the middle of getting rid of our SSIS packages and using stored procedures. For us, stored procs are tremendously better: 1) They are far easier to maintain, we don't need bids, don't need to create projects and import packages into bids, so far fewer steps to make simple stored proc changes.
