The Physics Classroom

In physics, motion is described through two sets of apparently contradictory laws of mechanics. Motions of all large-scale and familiar objects in the universe (such as projectiles, planets, cells, and humans) are described by classical mechanics, whereas the motion of very small atomic and sub-atomic objects is described by quantum mechanics.

The Physics (Greek: Φυσική ἀκρόασις *Phusike akroasis*; Latin: *Physica*, or *Naturales Auscultationes*, possibly meaning "lectures on nature") is a named text, written in ancient Greek, collated from a collection of surviving manuscripts known as the *Corpus Aristotelicum*, attributed to the 4th-century BC philosopher, teacher, and mentor of Macedonian rulers, Aristotle.

In two dimensions, either cartesian or polar coordinates may be used, and the use of unit vectors is common. A position vector \mathbf{r} may be expressed in terms of the unit vectors. In three dimensions, cartesian or spherical polar coordinates are used, as well as other coordinate systems for specific geometries. The vector change in position associated with a motion is called the displacement.

Physical Units. Mechanics is the branch of physics in which the basic physical units are developed. The logical sequence is from the description of motion to the causes of motion (forces and torques) and then to the action of forces and torques.
