Population Genetics. Population Genetics is the study of evolution from a genetic point of view (it is the study of microevolution) Microevolution —a change in the collective genetic material of a population. Population —members of the same species that can interbreed. It is the smallest unit in which evolution occurs.

Population genetics is a subfield of genetics that deals with genetic differences within and between populations, and is a part of evolutionary biology. Studies in this branch of biology examine such phenomena as adaptation, speciation, and population structure.. Population genetics was a vital ingredient in the emergence of the modern evolutionary synthesis.

### **Population genetics - Wikipedia**

Polyploidy, though less common in animals than it is in plants, appears to have played a role in the speciation in animals. Since evolutionists need an increase in information in the genome to go from molecules to man, polyploidy is claimed to be a mechanism to increase genetic information available to a population.

### **Animal Polyploidy: A Mechanism for Evolution? | Answers in ...**

My understanding is different species are unable to interbreed so this implies significant changes on the genetic level. Speciation tends to occur when populations are separated for significant periods and each group adapts to local conditions implying anatomical changes.

Speciation modes Artificial Speciation. Artificial speciation is the form of speciation that can be achieved by the input of human influence. By separating populations, and thereby preventing breeding, or by intentionally breeding individuals with desired morphological or genotypic traits, humans can create new, distinct species.

### **Speciation - Definition and Types | Biology Dictionary**

Speciation begins when barriers to reproduction within a population lead to two reproductively isolated populations whose alleles are no longer mixing. Speciation is the process through which new species form. A speciation event represents a branch point, where one genetic lineage splits into two.

### **Speciation - teach.genetics.utah.edu**

is the result of separating a population by means of a physical barrier, leading to the evolution of two or more populations. Genetic drift Sympatric speciation

### **Speciation Answer Key - HelpTeaching.com**

Explanation: . Sympatric speciation implies a speciation event while the populations exist within the same geographical region. Animals moving around more often does not really explain why speciation would occur differently, and plants are not necessarily less prone to chromosomal abnormalities.

### **Understanding Sympatric and Allopatric Speciation - AP Biology**

Genetic change in a population can be measured as a change in genotype frequency or allele frequency. A change in one doesn't necessarily mean a change in the other. Predicts that the frequencies of alleles and genotypes in a population will not change unless at least one of five forces acts upon the population.
