## Overview Of The Circulatory System

In most animals, the circulatory system is used to transport blood through the body. Some primitive animals use diffusion for the exchange of water, nutrients, and gases. However, complex organisms use the circulatory system to carry gases, nutrients, and waste through the body.

### 21.1. Overview of the Circulatory System - Concepts of ...

The circulatory system varies from simple systems in invertebrates to more complex systems in vertebrates. The simplest animals, such as the sponges (Porifera) and rotifers (Rotifera), do not need a circulatory system because diffusion allows adequate exchange of water, nutrients, and waste, as well as dissolved gases, as shown in Figure 2a.

The Circulatory System. The blood is pumped by the heart into the lungs, where capillaries run by small air-filled sacs, or aveoli. The hemoglobin (which gives blood its reddish color) in the blood cells pick up the oxygen to carry to the rest of the body, and the carbon dioxide in the blood plasma transfers back to the aveoli for...

### The Circulatory System - The Human Body: An Overview

The circulatory system delivers oxygen and nutrients to cells and takes away wastes. The heart pumps oxygenated and deoxygenated blood on different sides. The types of blood vessels include arteries, capillaries and veins.
