Lorentz reciprocity. Specifically, suppose that one has a current density that produces an electric field and a magnetic field, where all three are periodic functions of time with angular frequency ω , and in particular they have time-dependence $e^{-i\omega t}$. Suppose that we similarly have a second current at the same frequency ω which (by itself) produces fields and .

The magnetic moment is the magnetic strength and orientation of a magnet or other object that produces a magnetic field. Examples of objects that have magnetic moments include: loops of electric current (such as electromagnets), permanent magnets, elementary particles (such as electrons), various molecules, and many astronomical objects (such as many planets, some moons, stars, etc).

What affects the strength of a magnet? Material. As seen in the previous section, and copied below, the material the permanent magnet is made from has a significant effect on the overall strength of a magnet. The material will also determine how its flux is affected by temperature, and how easily the magnet can be demagnetized by opposing magnetic fields.
