In chemistry, resonance is a way of describing bonding in certain molecules or ions by the combination of several contributing structures (or forms, also variously known as resonance structures or canonical structures) into a resonance hybrid (or hybrid structure) in valence bond theory. It has particular value for describing delocalized electrons within certain molecules or polyatomic ions ...

Coal Coal is considered the remnant of plants that grew in swamps hundreds of millions of years ago, and thus its source is often characterized as terrestrial, signifying its association with continental land masses. Terrestrial plant material characteristically contains lignin, a carbon-based natural polymer that provides rigidity to nonaquatic plants and enables them to stand upright against ...

What is a physical change in matter? Molecules can move from one physical state to another (phase change) and not change their atomic structure. Oxygen (O₂) gas has the same chemical properties as liquid oxygen. The liquid state is colder and denser (less energy), but the molecules are the same.

Because they have these polar groups that also allow for hydrogen bonding, nylons and most condensation polymers are also stronger, more rigid and brittle, and tougher in comparison to most vinyl polymers. Nylons are also "lubrication-free," meaning they do not need lubricant for easy mobility; thus they can be used to make mechanical bearings and gears that do not need periodic lubrication.
