Time to play theoretical physicist. Newton's law of universal gravitation states that $F = G \cdot [(m_1 \cdot m_2) / (r^2)]$. Where F stands for the force between two masses, m stands for the mass of an object, and r is the distance between these two objects (G is a constant, so you can ignore it for this theoretical question).

Newton's Law of Universal Gravitation. So for Newton, the force of gravity acting between the earth and any other object is directly proportional to the mass of the earth, directly proportional to the mass of the object, and inversely proportional to the square of the distance that separates the centers of the earth and the object.

Newton's Law of Universal Gravitation - physicsclassroom.com

Thus, the greater the masses m_1 and m_2 , the greater the force of attraction between them, in direct proportion to the masses. The greater the distance of separation d , the weaker the force of attraction, in inverse proportion to the square of the distance between their centers of mass.
