Notice that at the endpoints, when $v = 0$, the mass has no kinetic energy, $KE = \frac{1}{2}mv^2$. Therefore, all of its energy is in the form of elastic potential energy, $PE_e = \frac{1}{2}kx^2$. When PE_e is maximum, the restoring force within the spring is also maximized resulting in the mass' acceleration also being maximized as the spring acts to return the mass to its equilibrium position.
