RNA and Protein Synthesis Answer Key. The codon molecule is a piece of mRNA that enters the nucleus and transcribes the sequence of nitrogen bases from the DNA strand. The DNA serves as the blueprint for the proteins that will be created through the process of protein synthesis. The mRNA then leaves the nucleus and travels to the ribosomes where other forms of RNA translate the code.

#### **RNA and Protein Synthesis Answer Key - HelpTeaching.com**

The first step of protein synthesis is called Transcription. It occurs in the nucleus. During transcription, mRNA transcribes (copies) DNA. DNA is "unzipped" and the mRNA strand copies a strand of DNA. Once it does this, mRNA leaves the nucleus and goes into the cytoplasm. mRNA will then attach itself to a ribosome.

Now that we've described DNA and RNA, it's time to take a look at the process of protein synthesis. The synthesis of proteins takes two steps: transcription and translation. Transcription takes the information encoded in DNA and encodes it into mRNA, which heads out of the cell's nucleus and into the cytoplasm.
