Overview of Sound Waves. by Ron Kurtus (revised 1 December 2009) Sound waves can be classified into three groups, according to their frequency ranges. Infrasound consists of frequencies below 20 Hz, audible sound consists of frequencies between 20 Hz and 20,000 Hz (20 kilohertz), and ultrasound consists of frequencies over 20 kHz.

A material's property (or material property) is an intensive property of some material, i.e. a physical property that does not depend on the amount of the material. These quantitative properties may be used as a metric by which the benefits of one material versus another can be compared, thereby aiding in materials selection.. A property may be a constant or may be a function of one or more ...

The mechanical vibrations that can be interpreted as sound can travel through all forms of matter: gases, liquids, solids, and plasmas. The matter that supports the sound is called the medium. Sound cannot travel through a vacuum.. Longitudinal and transverse waves. Sound is transmitted through gases, plasma, and liquids as longitudinal waves, also called compression waves.

The Different Types of Waves. There are two types of waves: mechanical waves like sound that must travel through a medium like air, and electromagnetic waves like light that don't. Both types of waves transfer energy in a wave-like manner, as that is what a wave is, a physical effect of energy being transferred over space and time. On this page, we explain the different types of waves, the ...
