Seawater - Acoustic properties: Water is an excellent conductor of sound, considerably better than air. The attenuation of sound by absorption and conversion to other energy forms is a function of sound frequency and the properties of water. The attenuation coefficient,  $\alpha$ , in Beer's law, as applied to sound, where  $I_z$  and  $I_0$  are now sound intensity values, is dependent on the viscosity of ...

Sound Insulation is the ability of building elements or structures to reduce sound transmission and is measured over a range of frequencies, normally 100 ~ 3150 Hz. On-site results often fall short of laboratory measurements, due to flanking etc... To compare sound insulation properties you need to take into account the area of the dividing partition/wall, as well as the volume and sound ...

Sonar (originally an acronym for sound navigation ranging) is a technique that uses sound propagation (usually underwater, as in submarine navigation) to navigate, communicate with or detect objects on or under the surface of the water, such as other vessels. Two types of technology share the name "sonar": passive sonar is essentially listening for the sound made by vessels; active sonar is ...
