I imagine if you climbed out of the shower only to discover you'd shrunk in the wash by about 1500 million times! If you stepped into your living room, what you'd see around you would not be chairs, tables, computers, and your family but atoms, molecules, proteins, and cells. Shrunk down to the "nanoscale," you'd not only see the atoms that everything is made from—you'd actually be able to ...

If the 20th century was the age of plastics, the 21st century seems set to become the age of graphene—a recently discovered material made from honeycomb sheets of carbon just one atom thick. Science journals have been running out of superlatives for this wondrous stuff: it's just about the lightest, strongest, thinnest, best heat- and electricity- conducting material ever discovered.

This is a belated observation, but the article was referred to in a recent Greatest hits from previous weeks newsletter, and I think this contribution might be worthwhile.. I've come across this distinction before but had forgotten it. On reading the article, one of the contributors says The well-worn example is that concrete consists of sand, gravel, cement, and water.

Temperature is another important variable. The above properties were measured at room temperatures. As temperatures increase up to the limit of 1,063°F (573°C) mentioned in Endnote 81, the piezoelectric coefficient increases and breakdown voltages decrease—both contributing to more extensive and powerful plasma production.. 81.

Concerning the Early History of Planet Earth. In a previous article, The Origin of the Solar System, some of the many peculiarities of our solar system and its origins were mentioned briefly. The sun for instance is 98% helium and hydrogen, the giant planets are mostly gaseous, but the terrestrial planets including the earth are almost entirely made up of heavier elements-earth is 90% iron ...

Quantum mechanics is the science of the very small. It explains the behavior of matter and its interactions with energy on the scale of atoms and subatomic particles. By contrast, classical physics explains matter and energy only on a scale familiar to human experience, including the behavior of astronomical bodies such as the Moon. Classical physics is still used in much of modern science and ...

Argon has approximately the same solubility in water as oxygen and is 2.5 times more soluble in water than nitrogen. Argon is colorless, odorless, nonflammable and nontoxic as a solid, liquid or gas. Argon is chemically inert under most conditions and forms no confirmed stable compounds at room temperature.. Although argon is a noble gas, it can form some compounds under various extreme conditions.
