This book builds theoretical statistics from the first principles of probability theory. Starting from the basics of probability, the authors develop the theory of statistical inference using techniques, definitions, and concepts that are statistical and are natural extensions and consequences of previous concepts.

Random Walk--1-Dimensional. Let steps of equal length be taken along a line. Let p be the probability of taking a step to the right, the probability of taking a step to the left, the number of steps taken to the right, and the number of steps taken to the left. The quantities p , q , n , and r are related by

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

In statistics, an expectation-maximization (EM) algorithm is an iterative method to find maximum likelihood or maximum a posteriori (MAP) estimates of parameters in statistical models, where the model depends on unobserved latent variables. The EM iteration alternates between performing an expectation (E) step, which creates a function for the expectation of the log-likelihood evaluated using ...

Algebraic and Number Theoretic Algorithms Algorithm: Factoring Speedup: Superpolynomial Description: Given an n -bit integer, find the prime factorization. The quantum algorithm of Peter Shor solves this in $\mathcal{O}(n^3)$ time [82,125]. The fastest known classical algorithm for integer factorization is the general number field sieve, which is believed to run in time $2^{\tilde{O}(\sqrt{n})}$...
