In nuclear chemistry, nuclear fusion is a reaction in which two or more atomic nuclei are combined to form one or more different atomic nuclei and subatomic particles (neutrons or protons). The difference in mass between the reactants and products is manifested as either the release or absorption of energy. This difference in mass arises due to the difference in atomic "binding energy" between ...

Fundamentally, a CANDU nuclear power plant generates electricity like most "thermal" electricity stations (i.e. those that use heat), which includes fossil-fuelled stations as well as most other

commercial nuclear stations in the world: Heat is used to boil water, which turns to high pressure steam, which flows through a turbine, which turns an electrical generator, which makes electricity.

PPII. But the 3 He nucleus does not always have to hit another 3 He nucleus. it could hit an 4 He nucleus. This is illustrated above, in table 2. Fusion with 4 He is less likely, because there is more 3 He around deep inside the stellar core. But in heavier stars, where the temperatures exceed about 24,000,000 Kelvins, the PPII chain can rival the PPI chain for energy production inside the star.
