The 3 different types of RNA carry out the DNA instructions to synthesize proteins. During transcription, the DNA code is transcribed by mRNA into the language of protein synthesis. Three base pair codons of mRNA carry this information to the ribosomes, where translation occurs.

Steroid hormones pass through the plasma membrane, the cytoplasm, and the nuclear membrane, they bind to receptors in the nucleus, activate a gene and initiate the transcription of mRNA, which leaves the nucleus, goes to a ribosome and undergoes translation and builds a protein; Protein hormones (also called non-steroid) do NOT enter the cell, they bind to receptors in the plasma membrane which activate secondary messengers inside the cell that start a cascade and amplification series of ...

RNA and Protein Synthesis Answer Key. The codon molecule is a piece of mRNA that enters the nucleus and transcribes the sequence of nitrogen bases from the DNA strand. The DNA serves as the blueprint for the proteins that will be created through the process of protein synthesis. The mRNA then leaves the nucleus and travels to the ribosomes where other forms of RNA translate the

code.

The most crucial of all maintenance systems of the cell's processes is protein synthesis. Without proteins, life would not exist as we know it. This unit provides that understanding of the basic cellular processes that unify all living organisms and provides a basis of understanding of molecular heredity.

The ribosomes free in the cytoplasm are more related to protein production for internal cellular consumption whereas those attached to the rough endoplasmic reticulum are more important in protein synthesis for exportation. Proteins made by attached ribosomes enter the rough endoplasmic reticulum and are later transferred to the Golgi apparatus.

Protein Synthesis Overview How exactly do all those letters in DNA code for making a living thing? The short answer is that the code of letters in DNA is a recipe to make proteins. Proteins form structures, enzymes or other chemicals to create the building blocks of organisms and maintain homeostasis.
