Problem 7. A magical four-sided die is rolled twice. Let S be the sum of the results of the two rolls. We are told that the probability that $S = k$ is proportional to k , for $k = 2, 3, \dots, 8$, and that all possible ways that a given sum k can arise are equally likely. Construct an appropriate probabilistic model and find the probability of getting

Consider a probability space specified by the triple (S, \mathcal{S}, P) , where (S, \mathcal{S}) is a measurable space, with S the domain and \mathcal{S} its measurable subsets, and P is a measure on S with $P(S)=1$. Then the measure P is said to be a probability measure. Equivalently, P is said to be normalized.

In Bayesian statistical inference, a prior probability distribution, often simply called the prior, of an uncertain quantity is the probability distribution that would express one's beliefs about this quantity before some evidence is taken into account. For example, the prior could be the probability distribution representing the relative proportions of voters who will vote for a particular ...
