ACIDS, BASES AND pH. There are millions of chemical substances in the world. Some of them have acidic properties, others, basic properties. Acids are substances which free hydrogen ions (H^+), when they are mixed with water. Bases are substances which free hydroxide ions (OH^-) when they are mixed with water. (This freeing of ions is called dissociation in both cases).

Ester names are derived from the parent alcohol and the parent acid, where the latter may be organic or inorganic. Esters derived from the simplest carboxylic acids are commonly named according to the more traditional, so-called "trivial names" e.g. as formate, acetate, propionate, and butyrate, as opposed to the IUPAC nomenclature methanoate, ethanoate, propanoate and butanoate.

As soon as the genetic code was biochemically cracked (Nirenberg et al., 1965), its non-random structure became evident (Woese, 1965, Crick, 1968). The most obvious pattern that emerged in the code was its regular redundancy. The code comprises 16 codon families beginning with the same pair of bases, and these families generally consist of either one or two equal series of codons mapped to one ...

In genetics, a sequence motif is a nucleotide or amino-acid sequence pattern that is widespread and has, or is conjectured to have, a biological significance. For proteins, a sequence motif is distinguished from a structural motif, a motif formed by the three-dimensional arrangement of amino acids which may not be adjacent.. An example is the N-glycosylation site motif:

Phytic acid is a substance found primarily in whole grains, beans, and nuts that reduces the absorption of specific minerals from food. I previously wrote that minimizing phytic acid may be an important part of a healthy diet, but new evidence—and a reexamination of old evidence—has convinced me that it probably isn't as important as I initially thought.
