Parts per million - ppm - is commonly used as a dimensionless measure of small levels (concentrations) of pollutants in air, water, body fluids, etc.. Parts per million is the molar mass, volume or mass ratio between the pollutant component and the solution. ppm is defined as. $\text{ppm} = \frac{1,000,000 \text{ c}}{\text{s}} = 10^6 \frac{\text{c}}{\text{s}}$ (1). where . c = molar mass, volume or mass of component (mole, m³, ft³, kg, lb m)

Divide the value from the previous calculation by 1,000. This converts the units of concentration into grams chemical per 100 milliliters. Since the grams of chemical per 100 milliliters solution is the same as percent weight per volume, this new value is the percent w/v, which is equivalent to your original ppm concentration value.

The basic formula is weight (or number of defects) divided by volume multiplied by 1,000,000 - or w/v x 1,000,000. For example, if you have 100 defective products in 10,000 manufactured pieces, divide 100 by 10,000 to arrive at the result of 0.01 or 1 percent of the total.

How to Calculate PPM | Sciencing

Parts per million (ppm), is a ratio of parts of solute to one million parts of solution, and is usually applied to very dilute solutions. It is often found in reports of concentration of water contaminants.
