New York City is primarily composed of sediments that were metamorphosed during the Taconic and Acadian orogenies roughly 500 - 400 million years ago. Garnets can be found in the rocks of the Hartland Formation and Manhattan Schist (view a NYC rock sample). It is in these hard rocks that the city ...

New York City Geology | AMNH

Conference Theme Overview We all live our lives forward, facing uncertain futures, yet social scientists feel most comfortable explaining the social world through causes rooted in the past or through the constraints and resources lodged in the present. Such explanations omit an important step: both historic and structural forces are refracted through the set of [...]

The human impact on natural ecosystems has reached dangerous levels, even significantly altering the Earth's basic chemical cycles, says a new report, World Resources 2000-2001: People and Ecosystems, The Fraying Web of Life. The report paints a dismal picture of over-fished oceans, over-pumping of water for farming, destruction of coral reefs and forests, even too much tourism, with human ...
