Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

This lab uses the glenco simulator, Virtual Lab: Population Biology to collect data on two populations of paramecium, *P. caudatum* and *P. aurelia*.. Though the simulator doesn't expressly say it, the activity illustrates the competitive exclusion principle by showing students how each population behaves when grown alone or when mixed together.

Did we all come from Adam and Eve like the Bible clearly states, or has the human species outgrown Adam and Eve? A recent article from The Economist covers the debate about whether all humans could have really come from just two people. It reports that at the November 2013 meeting of the Evangelical Theological Society in Baltimore, Maryland, a presentation about the latest in human genetics ...

The evolution of the peppered moth is an evolutionary instance of directional colour change in the moth population as a consequence of air pollution during the Industrial Revolution. The frequency of dark-coloured moths increased at that time, an example of industrial melanism. Later, when pollution was reduced, the light-coloured form again predominated.

Mutation As noted earlier, many biologists once thought that mutation by itself was the major cause of evolution. In the 1920s, however, British biologist J. B. S. Haldane (1892–1964), British statistician Ronald A. Fisher (1890–1962), and American geneticist Sewall Wright (1889–1988) published three different mathematical proofs showing that mutation by itself is insufficient.
