In chemistry, yield, also referred to as reaction yield, is the amount of product obtained in a chemical reaction. The absolute yield can be given as the weight in grams or in moles (molar yield). The percentage yield (or fractional yield or relative yield), which serves to measure the effectiveness of a synthetic procedure, is calculated by dividing the amount of the obtained desired product ...

In chemistry, a mixture forms when two or more substances are combined such that each substance retains its own chemical identity. Chemical bonds between the components are neither broken nor formed. Note that even though the chemical properties of the components haven't changed, a mixture may exhibit new physical properties, like boiling point and melting point.

Salinity In the early twentieth century, salinity was measured by chemically titrating the sample to measure the chloride (Cl^-) ion, then making use of the constant proportions of the major ions to Cl^- to calculate total salinity. In the 1950s and 1960s, it became clear that this procedure and calculation were not satisfactory for the precise measurements needed to distinguish and ...

Nitric acid (chemical formula HNO_3) is one of the most important inorganic acids. Eighth-century alchemists called it aqua fortis (strong water), aqua valens (powerful water), or spirit of nitre. It is a highly corrosive and toxic acid that can cause severe burns. Colorless when pure, older samples tend to acquire a yellow cast due to the accumulation of oxides of nitrogen.

Four lab-scale aerobic reactors were constructed using a 7.6 L glass container (desiccation jar, 27 cm height \times 23 cm wide) with a sealed lid (Anchor Hocking Company, Lancaster, OH) (Fig. 1, Figs. S2–S3). These (replicate) reactors were heated and maintained at $34 \pm 1^\circ\text{C}$ (digestate temperature) by a warm-water jacket to expedite the digestion.
