A digital signal processor (DSP) is a specialized microprocessor (or a SIP block), with its architecture optimized for the operational needs of digital signal processing.. The goal of DSP is usually to measure, filter or compress continuous real-world analog signals. Most general-purpose microprocessors can also execute digital signal processing algorithms successfully, but may not be able to ...

Every engineer knows that system-on-a-chip (SoC) verification is hard. Several widely cited studies have concluded that functional verification consumes 60% to 80% of the resources during the register-transfer-level (RTL) phase of a typical SoC project. It's quite common for development teams to ...
