The evolution of plants has resulted in a wide range of complexity, from the earliest algal mats, through multicellular marine and freshwater green algae, terrestrial bryophytes, lycopods and ferns, to the complex gymnosperms and angiosperms of today. While many of the earliest groups continue to thrive, as exemplified by red and green algae in marine environments, more recently derived groups ...

Evolutionary history of plants - Wikipedia

Plant defense against herbivory or host-plant resistance (HPR) describes a range of adaptations evolved by plants which improve their survival and reproduction by reducing the impact of herbivores. Plants can sense being touched, and they can use several strategies to defend against damage caused by herbivores. Many plants produce secondary metabolites, known as allelochemicals, that influence ...

1. Introduction. The human population is rapidly increasing and needs a substantial increase in agricultural productivity worldwide. However, various biotic and abiotic stresses are major factors limiting crop productivity .To feed the world population, productivity must be increased by 70% for an additional 2.3 billion people by 2050 .The mechanisms underlying environmental stress response

Southern Amaranth. Southern amaranth (also called giant pigweed) is a fast-growing giant of the marsh that returns from seed every spring on high mounds along shorelines that dry down or on levees around Lake Okeechobee. Southern amaranth has lance-shaped leaves on stalks that attach to the massive stem, and it produces multiple spikes of flowers.

Introduction. Soil salinity is a major environmental constraint to crop production, affecting an estimated 45 million hectares of irrigated land, and is expected to increase due to global climate changes and as a consequence of many irrigation practices [1, 2]. The deleterious effects of salt stress on agricultural yield are significant, mainly because crops exhibit slower growth rates, reduced ...

The first significant event in fertilization is the fusion of the membranes of the two gametes, resulting in the formation of a channel that allows the passage of material from one cell to the other. Fertilization in advanced plants is preceded by pollination, during which pollen is transferred to, and establishes contact with, the female gamete or macrospore.
