Controllability is an important property of a control system, and the controllability property plays a crucial role in many control problems, such as stabilization of unstable systems by feedback, or optimal control. Controllability and observability are dual aspects of the same problem.. Roughly, the concept of controllability denotes the ability to move a system around in its entire ...

An aftershock is a smaller earthquake that follows a larger earthquake, in the same area of the main shock, caused as the displaced crust adjusts to the effects of the main shock. Large earthquakes can have hundreds to thousands of instrumentally detectable aftershocks, which steadily decrease in magnitude and frequency according to known laws.

What is in-situ microscopy? In-situ transmission electron microscopy combines the image formation capabilities of the transmission electron microscope (TEM) with the application of one or more external stimuli to observe real-time sample dynamics. Currently, a wide variety of systems and holders are available to apply different stimuli to evaluate dynamics during electrical biasing ...

Dopamine is a potential integrator between the central nervous system and reproductive system in insects. To test for a possible action of dopamine on the male reproductive organ via hemolymph in honey bees, relative expression levels of dopamine receptor genes and second messenger levels responding to dopamine in the reproductive organ were quantified.

Functional gene expression of dopamine receptors in the ...

where q i is the ionic charge, u i is the mobility of each charge carrier and n i is the number of free charged species – dissolved ions or charged mobile clusters. The dissolution of salt in a solvent is generally associated with the dielectric constant of the medium, which governs the shielding of charges from each other and thereby influences ion pairing.

Ishizawa et al. report that hyperactivating the mitochondrial caseinolytic protease P (ClpP) degrades respiratory chain proteins, disrupts mitochondrial function, and selectively kills cancer cells, regardless of p53 status. They identify imipridones as hyperactivators of ClpP and show their antitumor activity.
