We can derive the following solution for step responses of overdamped systems, Equation 3.41 . Note that, as in the case of first-order systems, we can divide by kDu to develop a dimensionless output. Also, the dimensionless time is t/t and we can plot curves for dimensionless output as a function of z.This is done in Figure 3-8, which includes the critically damped case, as discussed next.

Price elasticity of demand (PED or E d) is a measure used in economics to show the responsiveness, or elasticity, of the quantity demanded of a good or service to a change in its price when nothing but the price changes.More precisely, it gives the percentage change in quantity demanded in response to a one percent change in price. Price elasticities are almost always negative, although ...

Model predictive control is a form of control in which the current control action is obtained by solving, at each sampling instant, a finite horizon open-loop optimal control problem, using the current state of the plant as the initial state; the optimization yields an optimal control sequence and the first control in this sequence is applied to the plant.
